

**AMENDMENTS TO THE CLAIMS**

*The claims have been amended as follows:*

1.-5. Cancelled.

6. (Currently Amended) A method for determining context of a user interface window, comprising steps of:

storing information relating to each user interface window existing within a computer operating system in a working database, the working database being different from real-time user interface window information maintained by the computer operating system;

determining a top user interface window at a selected display coordinate based on information stored in the working database;

determining an informational context for the top window based on the information stored in the working database;

receiving an input directed to the user interface window at the selected display coordinate; and

determining whether the top user interface window at the selected display coordinate is a system user interface window displaying system level properties of the computer operating system;

returning focus to a last user interface window having focus based on the determination that the top user interface window at the selected display coordinate is a system user interface window; and

recognizing the input directed to the top window based on the informational context of the top window.

7. (Original) The method according to claim 6, further comprising a step of selecting the user interface window at the selected coordinate using a digitizing pen.

8. (Original) The method according to claim 6, wherein the information stored in the working database for each user interface window existing within the computer operating system includes an HWND ClassName, an HWND Style and an ExStyle.

9. (Original) The method according to claim 8, wherein the information stored in the working database for each user interface window further includes at least one of whether the user interface window is a scrollbar; whether the user interface window is a text input field, whether the user interface window is a generic input field, whether the user interface window is a filename input field, whether the user interface window is an e-mail input field, whether the user interface window is a URL input field; whether an HWND is a button; whether the user interface window is a radio-button; whether the user interface window is a checkbox, and whether the user interface window is a slider.

10.-14. (Cancelled)

15. (Currently Amended) A computer-readable medium having computer-executable instructions for performing steps comprising:

storing information relating to each user interface window existing within a computer operating system in a working database, the working database being different from real-time user interface window information maintained by the computer operating system;

determining a top user interface window at a selected display coordinate based on information stored in the working database;

determining an informational context for the top window based on the information stored in the working database;

receiving an input directed to the user interface window at the selected display coordinate; and

determining whether the top user interface window at the selected display coordinate is a system user interface window displaying system level properties of the computer operating system;

returning focus to a last user interface window having focus based on the determination that the top user interface window at the selected display coordinate is a system user interface window; and

recognizing the input directed to the top window based on the informational context of the top window.

16. (Original) The computer-readable medium according to claim 15, further comprising computer-executable instructions for performing a step of selecting the user interface window at the selected coordinate using a digitizing pen.

17. (Original) The computer-readable medium according to claim 15, wherein the information stored in the working database for each user interface window existing within the computer operating system includes an HWND ClassName, an HWND Style and an Ex Style.

18. (Original) The computer-readable medium according to claim 17, wherein the information stored in the working database for each user interface window further includes at least one of whether the user interface window is a scrollbar; whether the user interface window is a text input field, whether the user interface window is a generic input field, whether the user interface window is a filename input field, whether the user interface window is an e-mail input field, whether the user interface window is a URL input field; whether an HWND is a button; whether the user interface window is a radio-button; whether the user interface window is a checkbox, and whether to user interface window is a slider.

19. (New) The method according to claim 8, wherein displaying system level properties of the computer operating system includes displaying at least one of a software button; a system hardware button; a tray icon; a gesture on a digitizing writing surface; and an in-air gesture.

20. (New) The computer-readable medium according to claim 15, wherein displaying system level properties of the computer operating system includes displaying at least one of a software button; a system hardware button; a tray icon; a gesture on a digitizing writing surface; and an in-air gesture.
